

Functional

- Users must be able to create accounts and log in.
- Customers must be able to review and rate products
- System must give users access to find content through search with filters of what kind of content they are searching for
- System must provide customer with cart to add products to purchase
- Companies must have access to creation and updating a product
- Customers must have 'saved' list to add products that they like but not want to add to cart
- Customers must be able to order products in the cart.

Non-Functional

- User-friendly interface: website should have intuitive and easy to navigate interface to ensure good experience for users
- Maintainability: code should be implemented clean to ensure that it can be updated and extended
- Performance: website needs to respond to user actions quickly, ensuring smooth browsing and searching
- Compatibility: website should be compatible with major browsers
- Data management: RDBMS should be used for management of storing a system's information
- Security: Sensitive information should be stored securely: encrypted instead of in plaintext format
